## About the Role

We are looking for a passionate and detail-oriented Software Verification Engineer to join our engineering team and help ensure the highest standards of software quality, reliability, and performance. This role offers an exciting opportunity to contribute to innovative solutions while working closely with software developers, application engineers, and cross-functional stakeholders.

As a Software Verification Engineer, you will be responsible for developing and executing verification strategies, designing automated test frameworks, and ensuring that software products meet functional, performance, and quality requirements before release. You will play a key role in driving continuous improvement of our verification processes, including exploring and implementing AI-driven testing capabilities.

For candidates with leadership aspirations, this position offers the opportunity to influence verification practices and contribute to the development of a growing verification function.

## Key Responsibilities

Develop, document, and execute comprehensive verification plans, test cases, and test procedures based on software and system requirements.

Design, implement, and maintain automated test frameworks and test suites covering unit, integration, regression, and system-level testing.

Evaluate and implement AI-driven approaches to enhance test automation efficiency, coverage, and quality.

Ensure end-to-end traceability between requirements, verification activities, and test results through well-maintained traceability matrices.

Design, establish, and maintain test environments, test rigs, and Hardware-in-the-Loop (HIL) setups where applicable.

Collaborate closely with Software Engineering, Star Cool Application Engineering, and Quality Assurance teams to define verification strategies, acceptance criteria, and release readiness requirements.

Identify, document, and track software defects while supporting root cause analysis and resolution activities.

Contribute to continuous improvement initiatives within software verification processes, tools, and methodologies.

Support the delivery of high-quality software releases through effective risk assessment and verification reporting.

## What We Are Looking For

## Required Qualifications

Bachelor's or Master's degree in Computer Science, Software Engineering, Electrical Engineering, or a related technical field.

Minimum 3 years of experience in software testing, software verification, validation, or quality assurance.

Strong understanding of Software Verification and Validation (V&V) principles and methodologies.

Proven experience developing and executing test cases based on requirements specifications.

Hands-on experience with automated testing frameworks such as PyTest, Robot Framework, Google Test, or similar tools.

Demonstrated experience leveraging AI technologies to improve automated testing solutions.

Proficiency in at least one programming or scripting language, preferably Python, C, or C++.

Experience with source control systems such as Git and CI/CD pipelines using tools such as GitHub Actions.

Solid understanding of the Software Development Lifecycle (SDLC) and Agile development methodologies.

Strong analytical, troubleshooting, and debugging capabilities.

Excellent attention to detail and a structured approach to problem-solving.

Strong communication and collaboration skills in an international, cross-functional environment.

## Preferred Qualifications

Previous experience leading or mentoring verification and testing teams.

Experience within a regulated or safety-critical industry, such as industrial controls, refrigeration systems, automation, or embedded systems.

Familiarity with requirements management and traceability tools such as Ease Requirements or equivalent platforms.

Experience with Hardware-in-the-Loop (HIL) testing and embedded software verification.

ISTQB Certification or equivalent testing qualification.

Experience working with modern software quality engineering practices and test automation at scale.

## Why Join Us?

At Maersk, you will be part of a global organization committed to innovation, digital transformation, and engineering excellence. You will have the opportunity to work with cutting-edge technologies, collaborate with talented colleagues across disciplines, and contribute to developing solutions that make a real impact on global trade and logistics.

Join us and help shape the future of software quality and verification.

Maersk Container Industry is dedicated to fostering a diverse and inclusive workplace, valuing different perspectives. As an equal opportunity employer, we welcome applicants of all backgrounds. We consider qualified candidates with criminal histories in accordance with legal requirements. We are committed to accommodating your needs during the application and hiring process. If you require special assistance or accommodations to use our website, apply for a position, or perform a job, please contact us.

Maersk Container Industry (MCI) produces refrigerated containers and refrigeration units for the intermodal sector, serving shipping lines, fruit multinationals, and leasing companies. We are driven by a desire to constantly improve the performance and efficiency of our product portfolio. Our aim is to ensure optimum cargo care and lowest energy costs, helping our customers meet their sustainability goals and reduce total cost of ownership in their operations.

Building on more than a century in the shipping industry and on strong company values, MCI is part of A.P. Moeller – Maersk, an integrated transport and logistics company with multiple brands and a global leader in container shipping and ports. Our headquarter including R&D, test facilities, Sales, After Sales Product Management, Customer Quality, Procurement and the business support functions are located in Denmark, with a production facility in China and a global network of 400 service providers.
