Application for the position of Software Verification Engineer — R198843

Dear Hiring Team,

At Roche, I developed automated tests for medical and laboratory software and assessed whether the results supported a release. I would like to bring that experience to MCI, where dependable software supports cargo care and energy-efficient refrigeration. Your role combines work I know well with the opportunity to develop verification practices together with an engineering team.

I bring around 15 years of automated testing experience. At Roche, I designed a cross-technology test framework and introduced automated UI and integration tests that improved regression stability. I also assessed remaining software risks and reported my findings to support release decisions. I would use that experience to help your team plan verification and make the results clear and useful to the people deciding on a release.

More recently, I have used AI to assist test creation and execution in my current project, an aerospace research project and the later phase of my work at MAN Truck & Bus. I review and validate the generated test code. At MCI, I would bring this practical approach to evaluating where AI can improve testing and where it still needs careful checking.

At MAN, I coached colleagues in testing, mocking and code reviews and helped align development standards across teams. Sharing practical examples and discussing implementation choices were part of that work. I would bring the same approach to working with your developers, application engineers and quality colleagues: making decisions understandable, sharing experience and finding solutions together.

I live in Sydals and would welcome a conversation about your verification work in Tinglev and how I can contribute to the team.

Yours sincerely,
Stefan Busch
