Application for the position of Principal Software Engineer

Dear Hiring Team,

Siteimprove's ambition to make AI a practical part of everyday product development is what draws me to the Principal Software Engineer role. I am particularly interested in combining hands-on engineering with technical direction and collaboration across teams. That is the setting in which I have made my strongest contribution: turning architectural intent into working software and shared engineering practice.

In a recent aerospace and defence project, and previously at MAN Truck & Bus, I designed and introduced ways of working with coding agents that supported requirements analysis, implementation, defect resolution and review. The resulting software was released to production through defined quality gates. At MAN, I also made architecture decisions across teams, recorded the reasoning in ADRs and stayed involved through implementation and operation.

My approach is practical and quality-conscious: architecture should help teams deliver and operate software, rather than become an end in itself. I work closely with developers, make trade-offs transparent and coach colleagues in maintainable design, testing and code reviews. At Roche, I brought the same approach to a regulated environment, establishing traceable validation and reliable delivery practices across technologies.

I would bring Siteimprove hands-on .NET engineering, experience in agent-assisted delivery and a practical approach to cross-team technical direction. I would welcome the opportunity to help the Search Insights team turn technical direction into dependable product improvements while working closely with the team's search specialists. Thank you for considering my application.

Yours sincerely,
Stefan Busch
